

Areas covered	Programming Fundamentals Basics – While & For
Practical Number	06
Module	CS102.3-Programming Fundamentals – 26.1

Question 1 - Write a Python program that prompts the user to enter marks for five subjects one by one. The program should calculate the total and average marks. Based on the average, the program should determine whether the student has passed or failed. If the average is greater than or equal to 50, display “Pass”; otherwise, display “Fail”.

Question 2 - Write a Python program that repeatedly asks the user to enter a PIN number until the correct PIN is entered. The correct PIN is “1234”. If the entered PIN is incorrect, display an appropriate error message and allow the user to try again. When the correct PIN is entered, display “Access Granted” and terminate the program.

Question 3 - Write a Python program that allows the user to enter the prices of five grocery items one by one. The program should calculate the total bill amount. If the total exceeds Rs. 5000, apply a 20% discount to the total amount. Finally, display the total amount, the discount applied, and the final payable amount.

Question 4 - Write a Python program that asks the user to enter five numbers. The program should determine whether each number is even or odd and keep a count of how many even numbers and odd numbers are entered. At the end, display the total count of even and odd numbers.

Question 5 - Write a Python program that allows the user to continuously enter deposit amounts. The program should stop accepting inputs when the user enters 0. It should calculate the total deposited amount. If the total deposit is greater than or equal to Rs. 10,000, display “Premium Customer”; otherwise, display “Regular Customer”.

Question 6 - Write a Python program that allows a user to enter a password with a maximum of three attempts. The correct password is “admin”. If the user enters the correct password within three attempts, display “Login Successful”. If the user fails to enter the correct password after three attempts, display “Account Locked”.

Question 7 - Write a Python program that prompts the user to enter electricity usage (in units) for three months. The program should calculate the total number of units consumed. If the total consumption exceeds 300 units, display “High Usage”; otherwise, display “Normal Usage”.

Question 8 - Write a Python program that allows the user to enter the stock quantity for five different products. The program should count how many products have a stock quantity less than 10. At the end, display the number of products that are considered low in stock.

Question 9 - Write a Python program that continuously accepts temperature values from the user. The program should stop when the user enters -1. It should count how many of the entered temperatures are above 30 degrees. Finally, display the count of high-temperature readings.

Question 10 - Write a Python program that allows the user to enter the sales amount for four employees one by one. For each employee, if the sales amount is greater than or equal to Rs. 5000, calculate and display a commission of 10% of the sales amount. Otherwise, display that no commission is awarded.
